Abstract

This project analyzes heart disease data using Tableau dashboards to identify patterns and risk factors.

Introduction

Interactive dashboards help healthcare professionals understand trends from patient data.

Problem Statement

Visualize heart disease data for better analysis and decision making.

Objectives

Create interactive dashboards, identify trends, and present insights.

Dataset

Heart disease dataset with demographic and clinical attributes.

Tools

Tableau Desktop, Excel/CSV, GitHub.

Data Preparation

Imported data, cleaned missing values, removed duplicates, verified data types.

Dashboard Development

Created KPIs, age, gender, cholesterol, blood pressure, chest pain, and heart-rate visualizations.

Screenshot Placeholders

Dashboard Screenshot 1: Overview

Dashboard Screenshot 2: Risk Factor Analysis

Dashboard Screenshot 3: Interactive Filters

Results

Older patients and patients with higher cholesterol and blood pressure showed higher risk trends.

Conclusion

The Tableau dashboard provides an effective visual analytics solution.

Future Scope

Integrate live data and predictive analytics.
